

THANK YOU FOR CHOOSING **POXYART** POXPASTE

PoxyPaste is a two-part Epoxy that can be used for Resin Art, Texture art, and making small Castings using silicone moulds.

BEFORE YOU START:

- Only mix as much paste as you need, rather mix too little and add more, than mix too much and waste.
- No need for a level surface as Poxypaste is non-flowing.
- Working in a warm room softens the two pasts to help with mixing.
- Cover your work area with a protective pvc plastic sheet, any spills will be hard to remove once set.
- Gloves are recommended purely because it can get messy.
- Before Poxypaste has set, it can be cleaned simply with water.
- Poxypaste can be tinted with a variety of pigments including inks, and paint.
- Always do small tests and experiments when using pigments as they may have different end results.

**PoxyPaste is a two-part Epoxy that is mixed as follows
(2 part Resin + 1part Hardener).**

**For sake of clarity in this guide we will be mixing enough to make 90ml Poxypaste.
(This can be scaled up according to your needs.)**

MIXING INSTRUCTIONS:

1. Add 60ml Resin (Part One) onto your mixing tray.
2. Add 30ml Hardener (Part Two) to the Resin to form a 90ml mixture.
3. Mix slowly but well until no streaks are visible in the mixture. (about 3mins)
4. At this stage, you can add a pigment or paint to colour your Paste or leave as is to. (mix well after adding pigments to get an even colour).
5. You can paint over the Paste after it has set.
6. Using your pallet knife or spatula, spread your Poxypaste onto the surface of your canvas/glass ect., to create different textures. You can also cast your mixture into your mould.
8. You have about 15minutes working time before the Poxypaste will start to gel (depending on room temperature).
9. Leave to set for 6-8hrs (depending on room temperature).
10. The Poxypaste should now be set solid and easily handled but cure to maximum hardness in 7 days.
